

Settings & Password (CrownConnect)

Settings & Password is shown in the lower right corner of the CrownConnect home screen.

From here there are a few options the user can select from. Usually once these are set, you will not need to adjust them after your initial set up.

Launch at Startup

It provides the user with the option to determine which **function** the screen will open to when logging into an account based on your preference.

Warn Me When Ordering

It will alert the user if they are placing an order for **product** they have **previously ordered** within the selected time frame (3-10 days). This will help to prevent double ordering product that may not yet have already arrived in the store. Check with your supervisor regarding what setting to choose based on the type of account you are servicing.

Show +/- Overlay

It provides the option to select which **side of the screen** various overlays will appear. This will make the overlay more accessible depending upon which hand the user is operating the screen with – right or left.

Show Time Tracking

This is applicable only to Fulltime employees.

Fulltime employees will see an additional choice to **Show Time Tracking** if they want to see what their part-time employees see for time tracking. This would need to be set for each visit to be visible.

Password & Advanced Settings

It provides additional settings that can be changed including **Update Password**. CrownConnect will prompt you to update and **change your password every 90 days**. Do not adjust any other settings unless instructed to by the Stratix Helpdesk.

It has 3 divisions (tabs).

1. User
2. Connection
3. Technical

User

It contains provision to enter the **Username** and **Password** to **register** the device, **unregister** the device and **update the password**.

Connection

It contains provision to enter the **Server Address**, **Domain Name** and **Security Configuration** to which the application wants to communicate.

Technical

It contains provision to enter the **Synchronization Parameters** like **Retry interval** (in minutes) and **Delay for Sync** (in minutes).

It also contains settings for Application Logs like **Enable logs** in **Console** and **Write application logs into memory**.
